CC7220-1 LA WEB DE DATOS PRIMAVERA 2018

LECTURE 3: RDF SCHEMA (RDFS) AND SEMANTICS

Aidan Hogan aidhog@gmail.com

LAST TIME ...

SEMANTIC WEB: DATA → RULES → QUERY → OUTPUT*

DATA:

```
RULES: "(b, \mathsf{capital}, a) \to (a, \mathsf{partOf}, b)"
"(a, \mathsf{partOf}, b), (b, \mathsf{partOf}, c) \to (a, \mathsf{partOf}, c)"
```

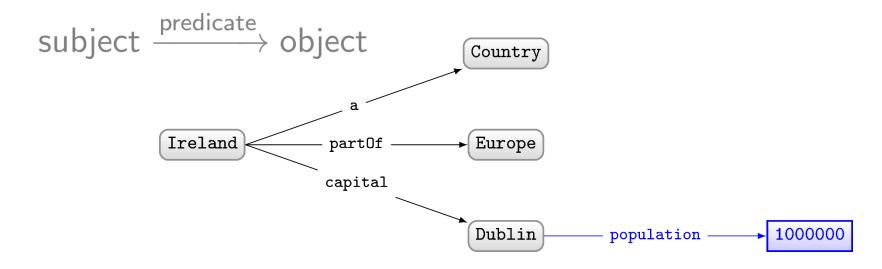

QUERY: "(x, partOf, y)?"

```
OUTPUT: \{(x \mapsto \mathsf{Ireland}, y \mapsto \mathsf{Europe}), (x \mapsto \mathsf{Dublin}, y \mapsto \mathsf{Ireland}), (x \mapsto \mathsf{Dublin}, y \mapsto \mathsf{Europe})\}
```

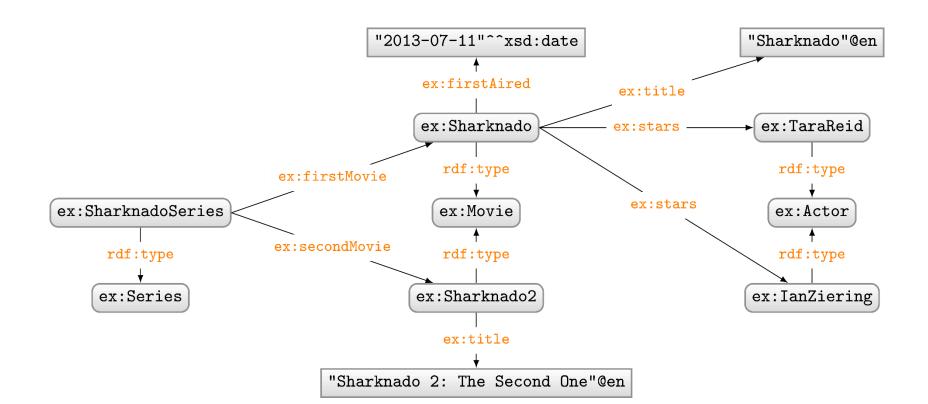

RDF often drawn as a (directed, labelled) graph

subject	predicate	object
Ireland	partOf	Europe
Ireland	a	Country
Ireland	capital	Dublin
Dublin	population	1,000,000

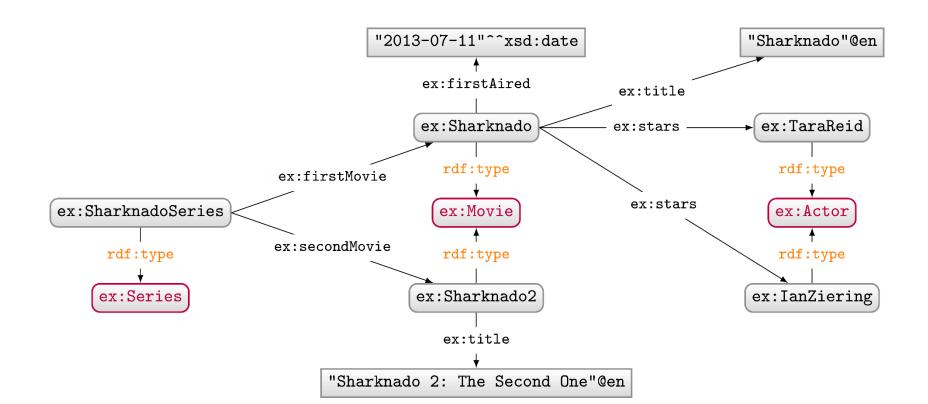

RDF Properties

- RDF Terms used as predicate
 - rdf:type, ex:firstMovie, ex:stars, ...

RDFCLASSES

- Used to conceptually group resources
 - ex:Movie, ex:Actor, ex:Series, etc.
 - Uses predicate rdf: type to type a resource

TODAY'S TOPIC ...

SEMANTIC WEB: DATA → RULES → QUERY → OUTPUT*

DATA:

```
(Ireland, partOf, Europe)
(Ireland, isA, Country)
(Ireland, capital, Dublin)
```

```
Dublin

(Ireland,capital,Dublin)

(Dublin,population,1000000)
```

```
Rules: "(b, \mathsf{capital}, a) \to (a, \mathsf{partOf}, b)" "(a, \mathsf{partOf}, b), (b, \mathsf{partOf}, c) \to (a, \mathsf{partOf}, c)"
```

QUERY: "(x, partOf, y)?"

OUTPUT:
$$\{(x \mapsto \mathsf{Ireland}, y \mapsto \mathsf{Europe}), \ (x \mapsto \mathsf{Dublin}, y \mapsto \mathsf{Ireland}), \ (x \mapsto \mathsf{Dublin}, y \mapsto \mathsf{Europe})\}$$

How to structure "rules"?

How should we structure rules on the Semantic Web?

RULES:
$$(a, \mathsf{capital}, b) \to (b, \mathsf{partOf}, a)$$

 $(c, \mathsf{partOf}, d), (d, \mathsf{partOf}, e) \to (c, \mathsf{partOf}, e)$

SEMANTIC WEB ANSWER: SCHEMA/ONTOLOGIES

- Don't use rules: Use RDF!
- Define relationships between classes and properties

What sorts of relationships might be useful to define between the following classes and properties?

ex:Town ex:hasCapitalCity

ex:hasCity

ex:City

ex:Country

foaf:familyName

ex:Place

foaf:Person

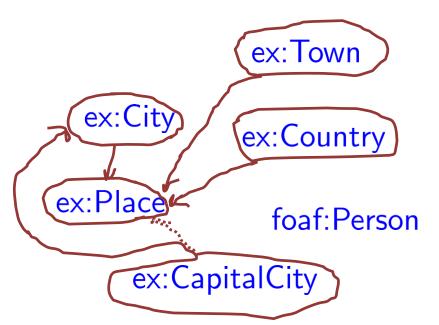

ex:geographicallyPartOf

ex:CapitalCity ex:partOf

CLASS HIERARCHY

- Class c is a sub-class of Class d
 - If (x,rdf:type,c) then (x,rdf:type,d),

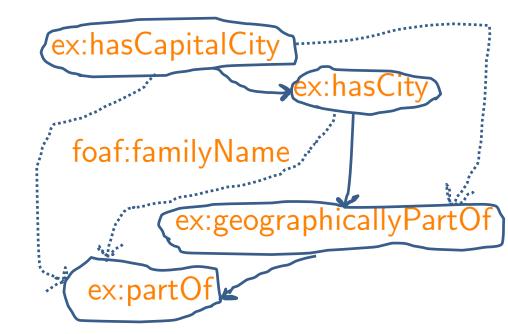

Which classes would be sub-classes of each other?

PROPERTY HIERARCHY

- Property p is a sub-property of q
 - If (x,p,y) then (x,q,y)

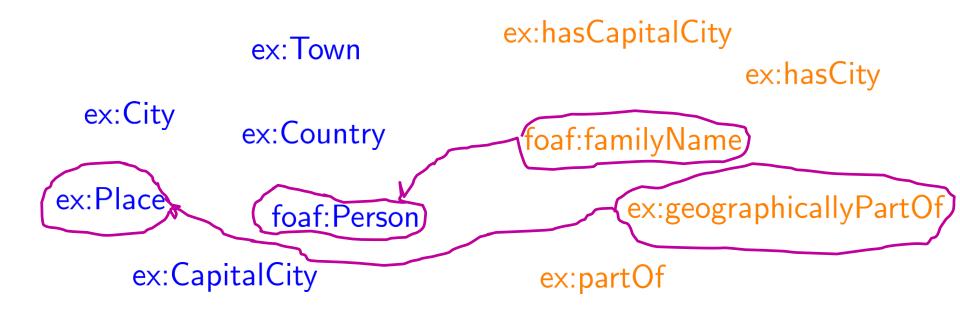

Which properties would be sub-properties of each other?

DOMAIN OF PROPERTIES

- Property p has domain class c
 - If (x,p,y) then (x,rdf:type,c)

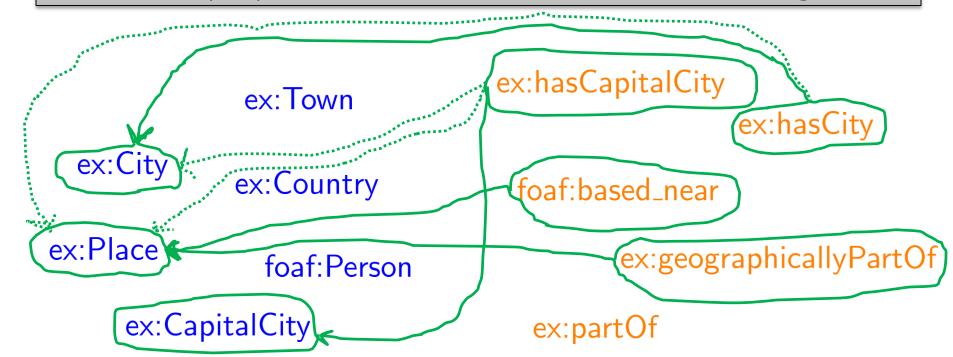

Which properties would have which classes as domain?

RANGE OF PROPERTIES

- Property p has range class c
 - If (x,p,y) then (y,rdf:type,c)

Which properties would have which classes as range?

Trade-off: More Specific / Less Reusable

- More specific → more conclusions
- Less specific → more reusable

Example: ex:hasCapitalCity has domain ex:Country

PRO: Know that anything that has a capital city is a country

CON: Cannot use for capitals of states, regions, etc.

Trade-off: More Specific / Less Reusable

- Another example:
 - ex:Mayor sub-class of foaf:Person

Bosco the dog

Mayor of Sunol, California 1981–1994 R.I.P.

Trade-off: More Specific / Less Reusable

- Another example:
 - ex:spouse has domain/range foaf:Person

BEWARE OF "HIDDEN" DEFINITIONS!

FOAF Vocabulary Specification 0.99

Namespace Document 14 January 2014 - Paddington Edition

Property: foaf:img

image - An image that can be used to represent some thing (ie. those depictions which are particularly representative of something, eq. one's photo on a homepage).

Status: testing

Domain: having this property implies being a <u>Person</u> **Range:** every value of this property is a <u>Image</u>

Any potential problems here?

(ex:Dublin, foaf:img, ex:Dublin_night.jpg)

Choose names of properties/classes carefully!

RDFS: RDF SCHEMA

RDFS (1.1): A WEB STANDARD

http://www.w3.org/TR/rdf-schema/

RDF Schema 1.1

W3C Recommendation 25 February 2014

This version:

http://www.w3.org/TR/2014/REC-rdf-schema-20140225/

Latest published version:

http://www.w3.org/TR/rdf-schema/

Previous version:

http://www.w3.org/TR/2014/PER-rdf-schema-20140109/

Editors:

Dan Brickley, Google

R.V. Guha, Google

Previous Editors:

Brian McBride

Please check the errata for any errors or issues reported since publication.

This document is also available in this non-normative format: diff w.r.t. 2004 Recommendation

RDFS: Describe "schema" in RDF

@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .

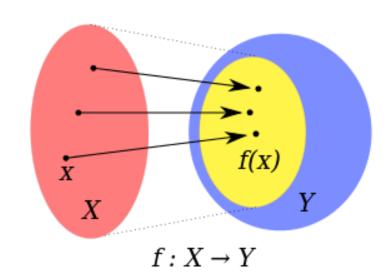

- Sub-class:
 - ex:CapitalCity rdfs:subClassOf ex:City .
- Sub-property:
 - ex:hasCapitalCity rdfs:subPropertyOf ex:hasCity .
- Domain:
 - foaf:familyName rdfs:domain foaf:Person .
- Range:
 - ex:hasCapitalCity rdfs:range ex:CapitalCity .
 - foaf:familyName rdfs:range xsd:string .

Note: Why called "domain" and "range"?

Any guesses why RDFS calls these "domain" and "range"?

$$f: X \longrightarrow Y$$

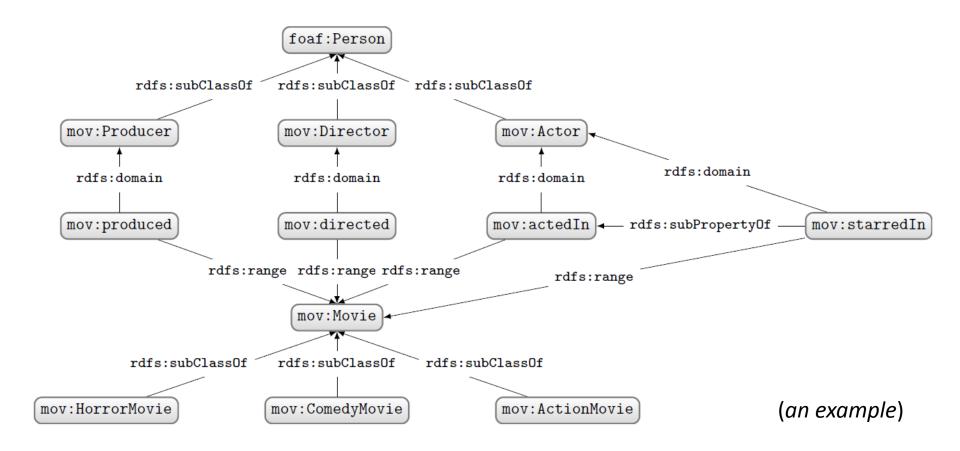

- X: domain of the function
- Y: co-domain of the function

• $\{f(x) \mid x \in X\}$: image or **range** of the function

SO LET'S BUILD AN RDF SCHEMA ...

Let's model an RDF Schema for movies, including different types of movies (horror, comedy, action), some different types of people involved (actor, producer, director), and how they are related.

BUT WHAT, E.G., IS THE DOMAIN OF ...?

ex:partOf rdfs:domain ?????

BUT WHAT, E.G., IS THE DOMAIN OF ...?

ex:partOf rdfs:domain rdfs:Resource

- rdfs:Resource the class of everything!
 - Yes, even itself!
 - (rdfs:Resource,rdf:type,rdfs:Resource)

(Giving domain/range/sub-class as rdfs:Resource says nothing new!)

SOME META-CLASSES ...

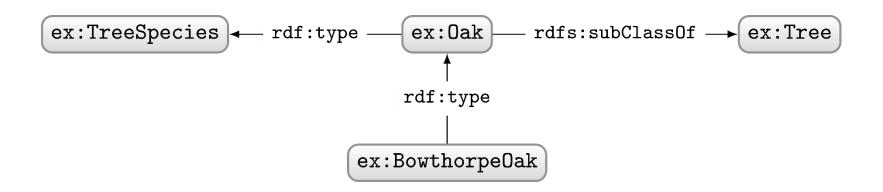

- rdf:Property: class of all properties
 - (ex:hasCity,rdf:type,rdf:Property)

- rdfs:Class: class of all classes
 - (ex:City,rdf:type,rdfs:Class)

Note: Class or instance?

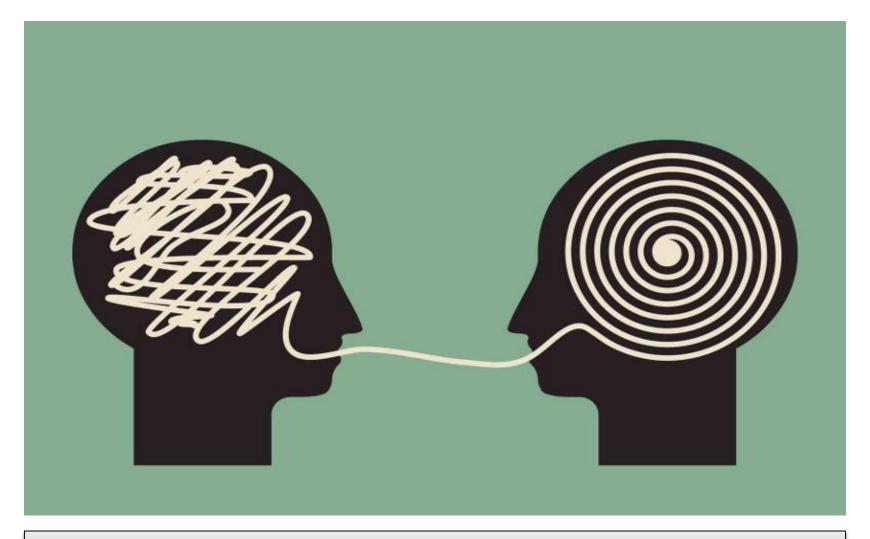

Would you define ex:0ak ("roble"@es) as a class or an instance?

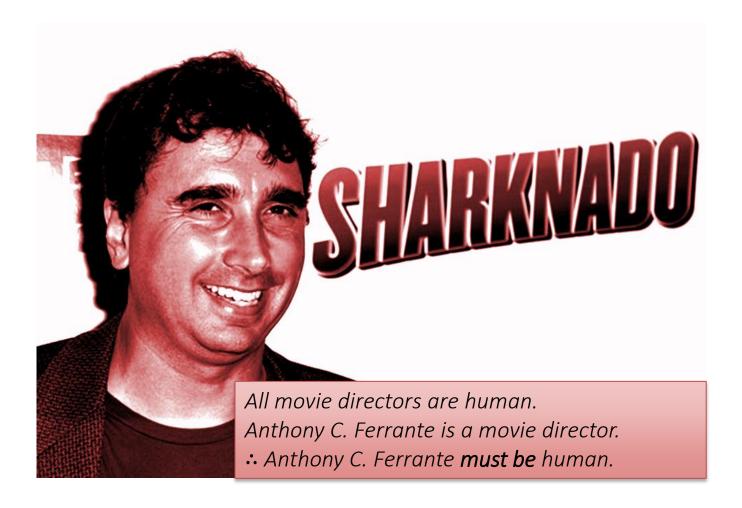

Classes can also "act" as instances: no strong distinction

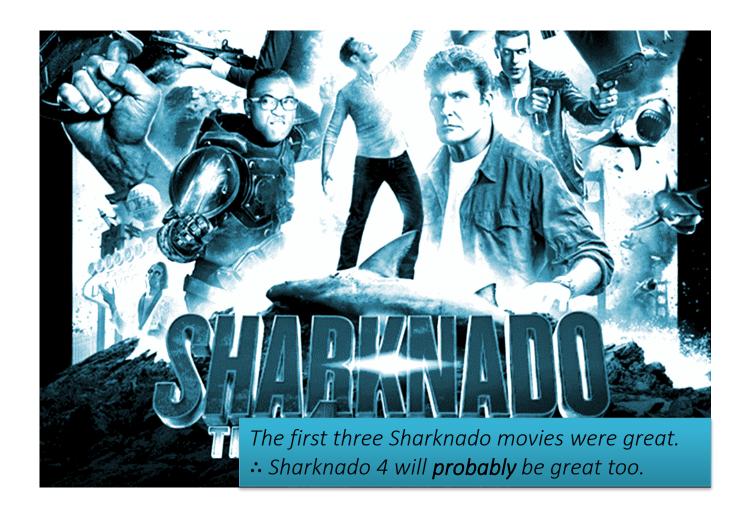

REASONING WITH RDFS

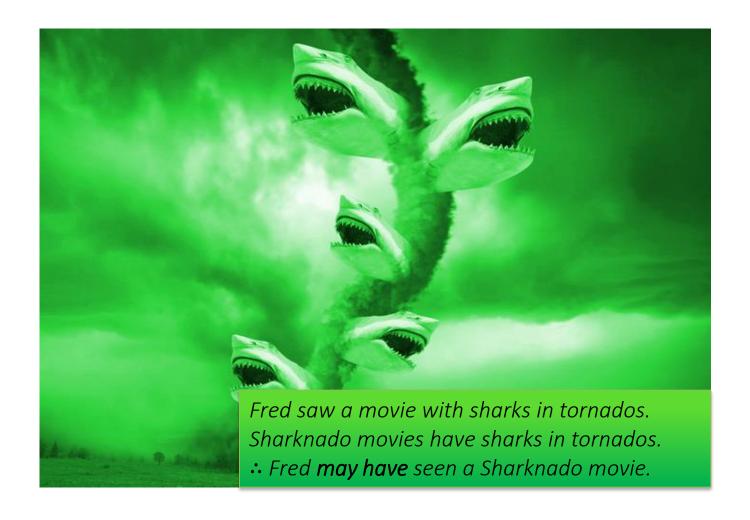

What general kinds of logical reasoning can we consider?

Deductive Reasoning: Make logical conclusion from rules/premises

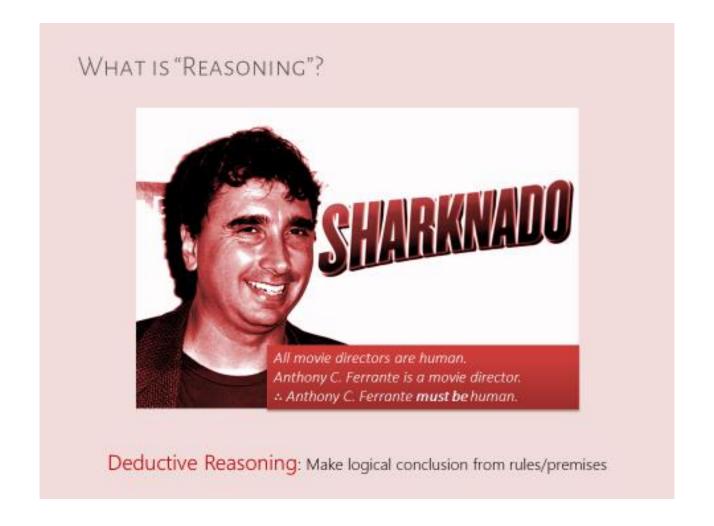

Inductive Reasoning: Learn approximate rule(s) from premises

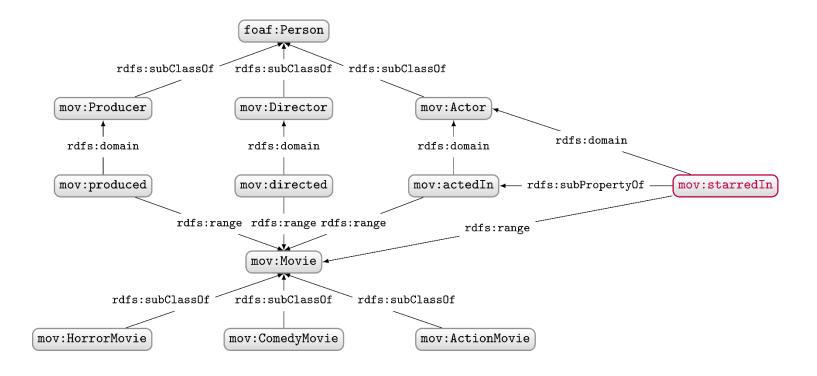

Abductive Reasoning: Guess a premise/explanation

RDFS reasoning is deductive ...

... THE ONLY FORM OF REASONING THAT IS "CERTAIN"

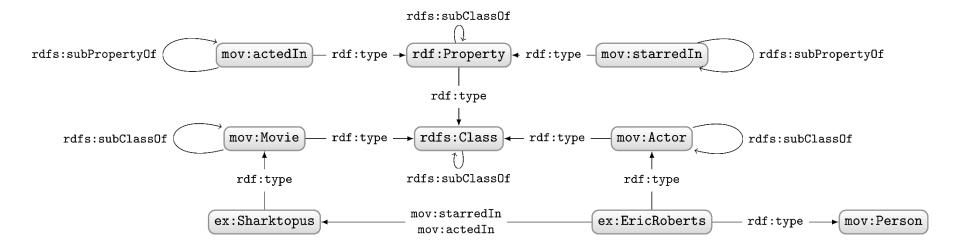

What conclusions can we deduce?

Given the above schema, what can we deduce from ...

ex:EricRoberts — mov:starredIn → ex:Sharktopus

SOME OF THE CONCLUSIONS ...

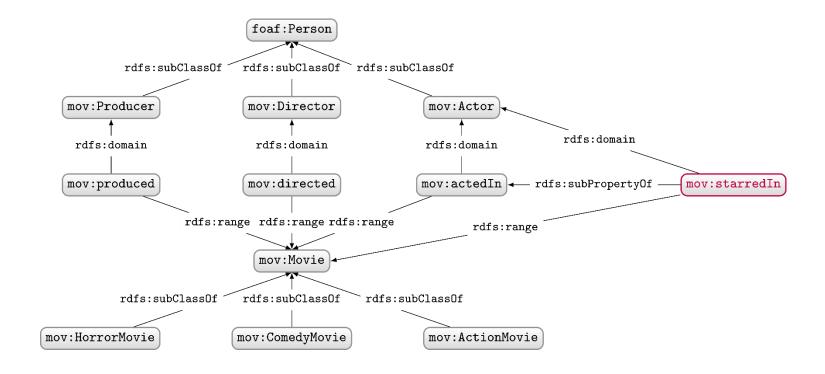

- Not shown (for the sake of my/our sanity):
 - Everything is of type rdfs: Resource
 - All classes are sub-class of rdfs: Resource
 - RDF/RDFS properties are of type rdf:Property

SHARKTOPUS JUST ONE MOVIE ...

ex:EricRoberts — mov:starredIn → ex:Sharktopus

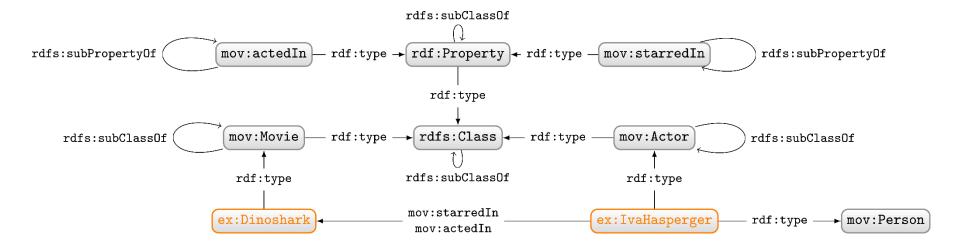

RDFS DEFINITIONS APPLY TO ANY MOVIE ...

Given the above schema, what can we deduce from ...

ex:IvaHasperger — mov:starredIn → ex:Dinoshark

RDFS DEFINITIONS APPLY TO ANY MOVIE ...

- Not shown (for the sake of my/our sanity):
 - Everything is of type rdfs:Resource
 - All classes are sub-class of rdfs: Resource
 - RDF/RDFS properties are of type rdf:Property

APPLY RDFS REASONING USING "RULES"

ID	if G matches	then G RDFS $_D$ -entails
rdfD1	?x ?p ?l . (?l a literal with datatype IRI dt(?l) $\in D$)	?x ?p _:b:b a dt(?1) .
rdfD2	?x ?p ?y .	?p a rdf:Property .
rdfs1	$\mathbf{\hat{u}}\in D$?u a rdfs:Datatype .
rdfs2	?p rdfs:domain ?c . ?x ?p ?y .	?x a ?c .
rdfs3	?p rdfs:range ?c . ?x ?p ?y .	?y a ?c .
rdfs4a	?x ?p ?y .	?x a rdfs:Resource .
rdfs4b	?x ?p ?y .	?y a rdfs:Resource .
rdfs5	?p rdfs:subPropertyOf ?q . ?x ?p ?y .	?x ?q ?y .
rdfs6	?p a rdf:Property .	?p rdfs:subPropertyOf ?p .
rdfs7	?p rdfs:subPropertyOf ?q . ?q rdfs:subPropertyOf ?r .	?p rdfs:subPropertyOf ?r .
rdfs8	?c a rdfs:Class .	?c rdfs:subClassOf rdfs:Resource .
rdfsg	?c rdfs:subClassOf ?d . ?x a ?c .	?x a ?d .
rdfs10	?c a rdfs:Class .	?c rdfs:subClassOf ?c .
rdfs11	?c rdfs:subClassOf ?d . ?d rdfs:subClassOf ?e .	?c rdfs:subClassOf ?e .
rdfs12	?p a rdfs:ContainerMembershipProperty .	?p rdfs:subPropertyOf rdfs:member .
rdfs13	?d a rdfs:Datatype .	?d rdfs:subClassOf rdf:Literal .

(Don't worry about rdfD1, rdfs1, rdfs12, rdfs13)

AXIOMATIC TRIPLES: ALWAYS TRUE IN RDFS

```
rdf:type
                    rdfs:domain rdfs:Resource ; rdfs:range rdfs:Class
rdfs:domain
                    rdfs:domain rdf:Property ; rdfs:range rdfs:Class
rdfs:range
                    rdfs:domain rdf:Property ; rdfs:range rdfs:Class
rdfs:subPropertyOf rdfs:domain rdf:Property ; rdfs:range rdf:Property .
rdfs:subClassOf
                    rdfs:domain rdfs:Class
                                              : rdfs:range rdfs:Class
rdf:subject
                    rdfs:domain rdf:Statement; rdfs:range rdfs:Resource.
rdf:predicate
                    rdfs:domain rdf:Statement; rdfs:range rdfs:Resource.
rdf:object
                    rdfs:domain rdf:Statement; rdfs:range rdfs:Resource.
rdfs:member
                    rdfs:domain rdfs:Resource; rdfs:range rdfs:Resource.
rdf:first
                    rdfs:domain rdf:List
                                              ; rdfs:range rdfs:Resource.
rdf:rest
                    rdfs:domain rdf:List
                                              ; rdfs:range rdfs:List
rdfs:see Also
                    rdfs:domain rdfs:Resource; rdfs:range rdfs:Resource.
rdfs:isDefinedBy
                    rdfs:domain rdfs:Resource ; rdfs:range rdfs:Resource .
rdfs:comment
                    rdfs:domain rdfs:Resource ; rdfs:range rdfs:Literal
rdfs:label
                    rdfs:domain rdfs:Resource ; rdfs:range rdfs:Literal
                    rdfs:domain rdfs:Resource; rdfs:range rdfs:Resource.
rdf:value
rdf: n
                    rdfs:domain rdfs:Resource; rdfs:range rdfs:Resource.
                                   rdfs:subClassOf rdfs:Container.
rdf:Alt
rdf:Bag
                                   rdfs:subClassOf rdfs:Container .
rdf:Seq
                                   rdfs:subClassOf rdfs:Container .
rdfs:ContainerMembershipProperty rdfs:subClassOf rdf:Property
rdfs:Datatype
                                   rdfs:subClassOf rdfs:Class
rdfs:isDefinedBy rdfs:subPropertyOf rdfs:seeAlso.
rdf:_n rdf:type rdfs:ContainerMembershipProperty.
```

REASONING IN RDFS OVER RDF GRAPH G

- 1. Add axiomatic triples to G
- 2. Apply rules exhaustively, adding conclusions to *G*, until nothing new found

Will this always finish? Or can it run forever?

RECAP

SEMANTIC WEB: DATA → RULES → QUERY → OUTPUT*

DATA:

```
(Ireland, partOf, Europe)
(Ireland, isA, Country)
(Ireland, capital, Dublin)
```

```
Dublin

(Ireland,capital,Dublin)

(Dublin,population,1000000)
```

```
Rules: "(b, \mathsf{capital}, a) \to (a, \mathsf{partOf}, b)" "(a, \mathsf{partOf}, b), (b, \mathsf{partOf}, c) \to (a, \mathsf{partOf}, c)"
```

QUERY: "(x, partOf, y)?"

OUTPUT:
$$\{(x \mapsto \mathsf{Ireland}, y \mapsto \mathsf{Europe}), \ (x \mapsto \mathsf{Dublin}, y \mapsto \mathsf{Ireland}), \ (x \mapsto \mathsf{Dublin}, y \mapsto \mathsf{Europe})\}$$

Don't Write rules: Write triples

- RDFS: RDF Schema
 - Allows for defining classes and properties
 - Written down in triples
 - Can be used for reasoning with rules

RDFS: RDF SCHEMA

RDFS has four <u>main</u> features:

- sub-class: an instance of a class c is an instance of its sub-class d
- sub-property: if two things are related by p, they are also related by its sub-property q
- domain: the subject of a relation with property p is the type of its domain c
- range: the object of a relation with property p is the type of its range c

A few other useful classes:

- rdf:Property: the class of all properties
- rdfs:Class: the class of all classes
- rdfs:Resource: the class of everything!
