*But where should this RDF come from?*

Most legacy data on the Web not in RDF!!

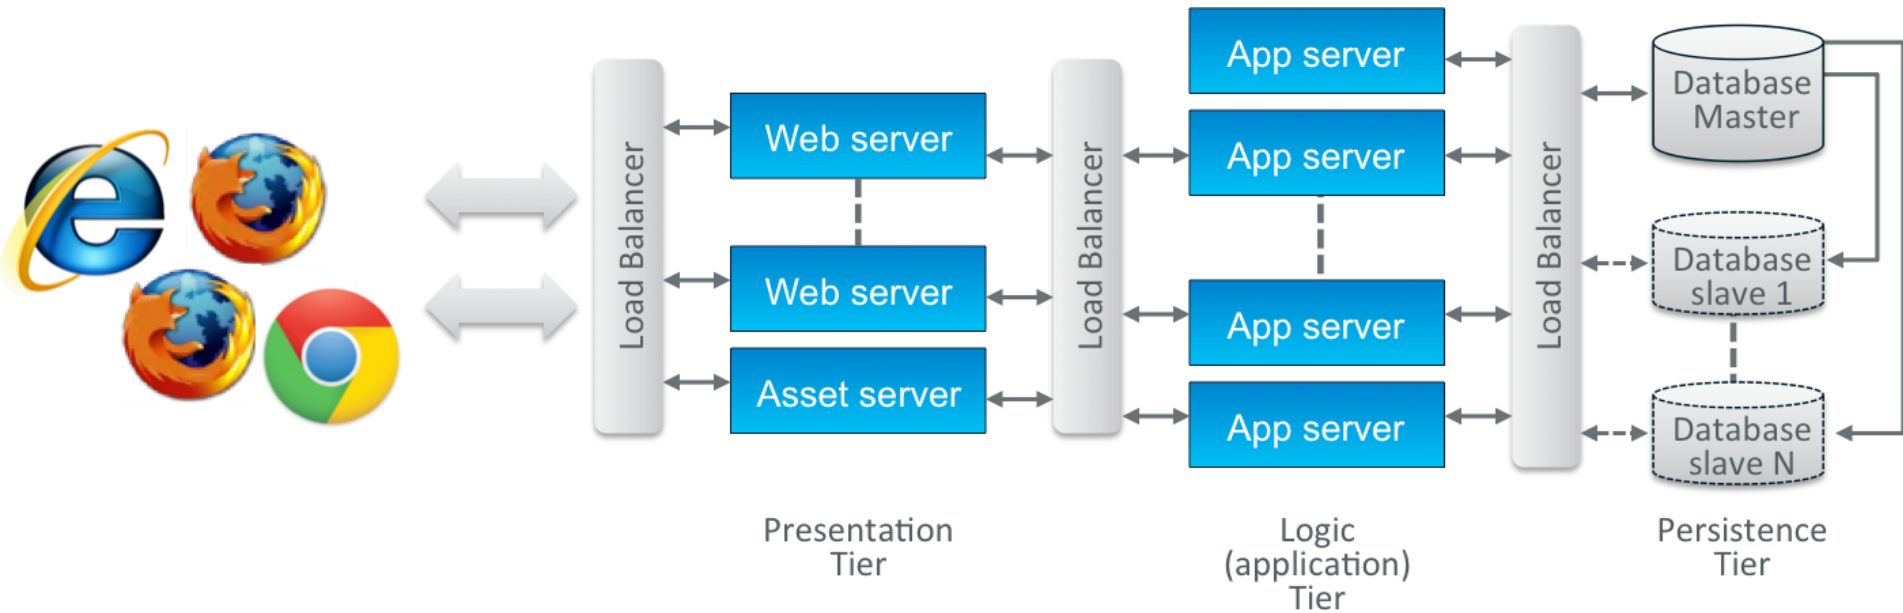

*So what legacy formats are common on the Web?*

# R2RML: Term Maps—Creating RDF Terms

**OPTION 1:** Specify a constant:

```
...  
rr:objectMap [ rr:constant "Solar System" ] ;  
...
```

**OPTION 2:** Select from a table column:

```
...  
rr:objectMap [ rr:column "dist" ] ;  
...
```

**OPTION 3:** Template using table columns:

```
...  
rr:objectMap [ rr:template "http://ex.org/Moon/{name}_{pname}" ] ;  
...
```

# R2RML: Term Maps—Constants

**OPTION 1:** Specify a constant:

```
...  
rr:objectMap [ rr:constant "Solar System" ] ;  
...
```

Or use the shortcut form:

```
...  
rr:object "Solar System" ;  
...
```

Can also use for IRIs:

```
...  
rr:object <http://ex.org/Solar_System> ;  
...
```

# R2RML: Term Maps—Columns

**OPTION 2:** Select from a table column:

```
...  
rr:objectMap [ rr:column "dist" ] ;  
...
```

By default generates ...

... literals for obj. (datatype based on RDB), IRIs for sub. or pred.

... but can use `rr:termType` to override:

`rr:IRI`, `rr:BlankNode` or `rr:Literal`

```
...  
rr:objectMap [ rr:column "homepage" ; rr:termType rr:IRI ] ;  
...
```

If a literal, can specify `rr:datatype` or `rr:language`

```
...  
rr:objectMap [ rr:column "dist" ; rr:datatype xsd:float ] ;  
...
```

```
...  
rr:objectMap [ rr:column "name" ; rr:language "en" ] ;  
...
```

# R2RML: Term Maps—Templates

**OPTION 3:** Template using table columns:

```
...  
rr:objectMap [ rr:column "http://ex.org/Moon/{name}_{pname}" ] ;  
...
```

By default generates IRIs ...

... but can use `rr:termType` to specify:

`rr:IRI`, `rr:BlankNode` or `rr:Literal`

```
...  
rr:objectMap [  
  rr:template "{name}_{pname}" ;  
  rr:termType rr:Literal  
] ;  
...
```

If a literal, can (again) specify `rr:datatype` or `rr:language`

# R2RML: Term Maps

Term map should not break restrictions on positions:

<i>subject</i>	<i>predicate</i>	<i>object</i>
[IRI, Blank Node]	[IRI]	[IRI, Blank Node, Literal]

# R2RML: Example of Term Maps

```
@prefix ...  
<PlanetMap> a rr:TriplesMap ;  
  rr:logicalTable [ rr:tableName "Planet" ] ;  
  
  rr:subjectMap [  
    rr:template "http://ex.org/p/{name}"  
  ] .  
  
  rr:predicateObjectMap [  
    rr:predicate <http://ex.org/v/dist> ;  
    rr:objectMap [ rr:column "dist" ; rr:datatype xsd:float ]  
  ] .
```

# R2RML ...

**RECAP**

# RDB2RDF

- Lots of legacy data in Relational DataBases
  - Would be nice if we could map that to RDF 😊
- **Direct Mapping**: Automatic
  - Automatic term generation
  - Automatic links based on foreign keys
  - Not customisable
- **R2RML**: Write custom mappings
  - Logical tables (table name/SQL query)
  - Term maps (S/P/O/G)

# End of new material!
